S.A WELY MISSION

UNIVERSAL SCIENTIFIC & TECHNOLOGICAL INNOVAT

Was reached to modern technology to purification and desalination the Water , Have been discovered and studied by scientists specialists From University " Ivan Joagshvili " And " Georgian University of Technology " In the Republic of Georgia , This technique provides for Water filtration and desalination And give different outcomes of water on demand , Where this technique produces different types of water It Has the ability To produce the Sterile water That Use In Medicine This assures us the extent of technical development for , He also stressed the director of the scientists "Vasily shvledzi " This technique has many advantages It's also more economical and more productive than other techniques Which are found in other desalination projects In terms the electrical energy it consumes less energy from the other techniques By a significant amount , And it does not need to sterile materials nor to the Expensive filters , We can also set up other projects Operates on the basis of the work of this technique such as Projects for fertilizer production and raw materials in construction and salt production in all its types , As this technique can get rid of radioactive materials from contaminated water and even in case of emergency This is what enabled her to be the first technology to treat water of nuclear reactors And recycle to be used again There are a range of other advantages of this technique Such as the purification of sewage and industrial effluents and other .
